

Additions to the Flora of Kerala since Gamble (1935)

K.S. Manilal and K. Raveendrakumar*

Department of Botany, University of Calicut, Calicut - 673 635, Kerala, India

Abstract

In the absence of a separate Flora of Kerala, Gamble's *Flora of the Presidency of Madras* (1915-35) is the usual authority that is consulted by general taxonomists and students for the study and identification of flowering plants of Kerala. As a large number of new species and records reported since then, has made Gamble's Flora obsolete, an attempt is made here to collect all the scattered published information available on the subject. Details regarding 625 new taxa that belong to 103 families, of which seven families are new to Kerala are compiled and presented. Of these new taxa, 240 are new to the world flora, with six new genera, 190 new species, three new sub-species and 41 new varieties.

The maximum number of new reports is from Orchidaceae with 118.9% increase in comparison with Gamble, followed by Zingiberaceae (88.2%) and Araceae (69.2%). The localities from where the maximum new reports are recorded are Silent Valley of Palghat District (36) and Chandanathode of Kannur District (33). Possible reasons for these are suggested. A complete list of References is provided for verification of details and further information about the additions to the Flora recorded.

INTRODUCTION

The first book ever printed on the Flora of any part of Kerala was *Hortus Malabaricus* by H.A. Van Rheede, published in 12 volumes from Amsterdam during 1678 - 1693. It contained the descriptions and illustrations of medicinal and other economically important plants found mostly in and around Cochin. Linnaeus was so impressed by this book that in his *Species Plantarum* (1753), the nomenclature of many of his Indian and other Asian plants were based on the information given in it. During the seventeenth and eighteenth centuries many European Botanists such as Herman, Boerhaave, Adriaan van Royan, Johannes Burman, George Everhard Rumphius, Paul Herman, W. Roxburgh and many others also established the binomial nomenclature of many taxa based on *Hortus Malabaricus*.

* Sree Vyasa N.S.S. College, Vyasagiri P.O., Wadakkanchery, Thrissur - 680 623, Kerala, India.

K.S. Manilal and K. Raveendrakumar

The illustrated series of South Indian plants published by Robert Wight in the middle of 19th century contained many taxa found in Kerala. The multi-volume *Flora of British India* by Joseph Dalton Hooker was published during 1872-1897, which covered the Kerala region also. This was followed by many detailed regional Indian Floras like the *Flora of Upper Gangetic Plains* by J.F. Duthie (1903), *Flora of Bihar and Orissa* by H.H. Haines (1921-1924), *Flora of Bombay Presidency* by T. Cooke (1903-1908), etc.

Forest Trees of Travancore, published in 1908 by Bourdillon and the *Flowering Plants of Travancore* in 1914 by Rama Rao are other important works on the flora of this region in that period. A comprehensive *Flora of the Presidency of Madras* was begun by J. S. Gamble in 1915 and completed by C.E.C.Fischer in 1935, which covered large parts of the present day Tamil Nadu, Karnataka, Andhra Pradesh and Kerala.

Although no separate Flora of Kerala State has been published yet, floristic explorations have been going on in many parts of Kerala in greater or lesser detail. These localised studies have resulted in the publication of many papers and books, reporting many new taxa and many new records of taxa in Kerala. Notable among such books are the *Flora of Calicut* by K.S.Manilal & V.V.Sivarajan published in 1982, *Flora of Silent Valley* by K.S.Manilal published in 1988, *Flora of Cannanore* by V.J.Nair & V.S.Ramachandran published in 1988, *Flora of Palghat* by E.Vajravelu published in 1990, *Flora of Kerala: Grasses* by Sreekumar & Nair published in 1991, *Flora of Nilambur* by V.V.Sivarajan & Philip Mathew published in 1996 and *Flowering Plants of Thrissur Forest* (Western Ghats, Kerala, India) by N. Sasidharan and V.V. Sivarajan in 1996. A number of papers have also been published by Ansari, R., Joseph, J., Joseph, K.T., Karthikeyan, S., Sathish Kumar, C., Mukthesh Kumar, M.S., Mangaly, J.K., Manilal, K.S., Philip Mathew, Nair, K.K.N., Nair, N.C., Nair, V.J., Nayar, M.P., Pradeep, A.K., Ramachandran, V.S., Ravi, N., Renuka, C., Sabu, M., Sabu, T., Sasidharan, N., Sivadasan, M., Sivarajan, V.V., Sreekumar, P.V., Subramanian, K.N., Swaroopanandan, K., Thothathri, K., Vajravelu, E., Vasudevan Nair, R., Velayudhan, K.C. and several others (for details see the References), adding to our knowledge on the subject. *An Annotated Bibliography of Taxonomic Botany of Peninsular India 1959-1978*, by Karthikeyan, S., Nayar, M.P. & Vijayaraghavan, R.S., the *Key Works to the Taxonomy of Flowering Plants of India* (1984) by Nayar, M.P., and *Malvaceae of Southern Peninsular India* (1996) by V.V.Sivarajan and A.K.Pradeep are worthy of special mention as useful references in the study of the floristic works of this region.

All these studies undertaken after Gamble's work, have brought to light several new taxa and new records that were not found in his Flora. Since these information lie scattered in various research papers, reports and other publications, many of which are difficult to locate, general taxonomists and students who consult Gamble which is the only comprehensive Flora available for the region today, are misled and do not get a clear and factual picture of the Flora of Kerala or even of the information on the subject which is already in print and is

Additions to the Flora of Kerala

expected to be available. A compilation of the available information on the subject has been a long felt need and the present paper is an attempt to fill this urgent exigency.

MATERIALS AND METHODS

Information about all the new taxa, new records and new combinations of angiosperms reported from Kerala since Gamble, is collected and given here. Families are arranged in alphabetical order. Names of taxa under each family are also arranged alphabetically. Additional information such as the locality from where the taxa were reported and the reference number for the concerned publication to facilitate easy checking of the original publication given under the **References**, are provided.

ANALYSIS OF ADDITIONAL DATA COLLECTED

An analysis of the number of taxa reported under each family is given in Table 1, giving details such as new genus, new species, new variety, new sub-species and new report. Information regarding 625 new taxa coming under 103 different families are found to be published by various workers since Gamble. Of these, 240 are new additions to the world flora. This includes six new genera, *Kanjaram* (Acanthaceae), *Haplothismia* (Burmanniaceae), *Chandrasekharania* and *Silentvalleya* (Poaceae), *Seidenfadeniella* (Orchidaceae) and *Janakia* (Periplocaceae); 193 new species, three new sub-species and 41 new varieties. Apart from the new taxa, some relevant new combinations are also included in the list.

An analysis of the percentage of new reports from Kerala since Gamble might reveal the reason for the high percentage of increase of taxa in certain families occurring here. Eight families with the highest percentage of new reports are shown in Table 2.

Table 2. Families with 15 or more new reports in comparison with Gamble's Flora

8	ZINGIBERACEAE	17	15	32	88.2

K.S. Manilal and K. Raveendrakumar

From Table 2, the percentage of new taxa recorded, reveal that Orchidaceae, Zingiberaceae and Araceae are the families which show a very high increase in number since Gamble. This may be due to the fact that these families were extensively studied by specialists of those families. Students of Taxonomy who wish to study these families are therefore subjected to serious limitations if their consultation and reference is limited to Gamble's Flora alone.

Localities from where new reports have been made have also been recorded separately. The maximum number of reports are from Silent Valley - 36 (Palakkad Dt.) Chandanathode - 33 (Kannur Dt.) and Thenmala - 21 (Kollam Dt.). Localities with 5 or more reports include Agasthyamala (15), Thenhipalam (11), Peerumedu (11), Bonaccord (10), Ponmudi (10), Idukki (10), Nilambur (10), Devicolam (10), Attapadi (9), Anamudi (9), Nelliampathi (9), Cochin (8), Peechi (8), Shenduruny (8), Sabarimala (6), Changanassery (6), Bramhagiri (6), Eravikulam (6), Tirunelli (6), Theerthundamala (6), Parambikulam (5), Kannothe (5), Parumba (5). In addition to this, there are many reports where localities are not mentioned specifically. They are grouped under three categories such as General: Travancore (25), General: Western Ghats (23), and General Malabar (6). Localities from where five or more new reports are made are shown in the map (Fig. 1).

An analysis of the different localities show that the new reports are chiefly from forest areas and high ranges of Western Ghats. The district-wise analysis shows that Kannur with 99 reports tops the list, followed by Palakkad with 95, Idukki 80, Thiruvananthapuram 68, Kollam 57, Kozhikode 43, Wynaad 39, Thrissur 31, Malappuram 27, Eranakulam 20, Pathanamthitta 19, Kottayam and Alappuzha 17 each and Kasaragod 15. The large number of reports from Kannur, Palakkad, Idukki, Thiruvananthapuram, Kollam, Kozhikode etc. may be due to more exploratory floristic studies conducted in these regions. Reports below five taxa per locality also support the above statement. The study also indicates that forested areas in the comparatively undisturbed mountain regions harbour a rich flora, further thorough explorations of which may reveal the presence of more additional or unknown taxa.

A list of localities arranged district-wise is given in Table 3, with their respective reference numbers, provided in the enumeration.
